

**Table 9** Summary of RL-based decentralized, partially decentralized, and centralized routing models

Ref.	Technique (selection)	Application (network)	Dataset	Features <sup>a</sup>	Action set	Evaluation Settings <sup>a</sup>	Improvement <sup>b</sup>
AdaR [461]	Partially decentralized LSP ( $\epsilon$ -greedy)	Unicast routing (WSN)	Simulations -400 sensors -20 data sources -1 sink	State: $\mathcal{N}_i$ Reward: function of - node load - residual energy - hop cost to sink - link reliability	Next-hop nodes to destination	<ul style="list-style-type: none"> <li><math>S = \#nodes</math></li> <li><math>A = \#neighbors</math></li> </ul>	Compared to Q-learning: <ul style="list-style-type: none"> <li>Faster convergence (by 40 episodes)</li> <li>Less sensitive to initial parameters</li> </ul>
FROMS [151]	Q-learning (variant of $\epsilon$ -greedy)	Multicast routing (WSN)	Omnet++ Mobility Framework with 50 random topologies -50 nodes -5 sources -45 sinks	State: $(\mathcal{N}_i^k, D_k)$ Reward: function of hop cost	$\{a_1 \dots a_m\}$ $a_k = (\mathcal{N}_i^k, D_k)$ $\mathcal{N}_i^k =$ next hop along the path to sink $D_k$	<ul style="list-style-type: none"> <li><math>S = \#nodes</math></li> <li><math>A = \#neighbors</math></li> </ul>	Compared to directed diffusion: <ul style="list-style-type: none"> <li>up to 5x higher delivery rate</li> <li><math>\approx 20\%</math> lower overhead</li> </ul>
Q-PR [24]	Variant of Q-learning ( $\epsilon$ -greedy)	Localization-aware routing to achieve a trade-off between packet delivery rate, ETX, and network lifetime (WSN)	Simulations -50 different topologies -100 nodes	State: $\mathcal{N}_i$ Reward: function of - distance( $\mathcal{N}_i, \mathcal{N}_j$ ) - distance( $\mathcal{N}_j, d$ ) - energy at $\mathcal{N}_j$ - ETX - $\mathcal{N}_i$ 's neighbors for any neighbor $\mathcal{N}_j$ and destination	Next-hop nodes to destination	<ul style="list-style-type: none"> <li><math>S = \#nodes</math></li> <li><math>A = \#neighbors</math></li> </ul>	Delivery rate: <ul style="list-style-type: none"> <li>25% more than GPSR</li> </ul> Network lifetime <ul style="list-style-type: none"> <li>3x more than GPSR</li> <li>4x more than EFE</li> </ul>
Ref.	Technique (selection)	Application (network)	Dataset	Features <sup>a</sup>	Action set	Evaluation Settings <sup>a</sup>	Improvement <sup>b</sup>
Xia et al. [482]	DRQ-learning (greedy)	Spectrum-aware routing (CRN)	OMNET++ simulations - stationary multi-hop CRN - 10 nodes - 2 PUs	State: $\mathcal{N}_i$ Reward: # available channels between current node and next-hop node	Next-hop nodes to destination	<ul style="list-style-type: none"> <li><math>S = \#nodes</math></li> <li><math>A = \#neighbors</math></li> </ul>	Compared to Q-routing: <ul style="list-style-type: none"> <li>50% faster at lower activity level</li> </ul> Compared to Q-routing and SP-routing: <ul style="list-style-type: none"> <li>lower converged end-to-end delay</li> </ul>
QELAR [197]	Model-based Q-learning (greedy)	Distributed energy-efficient routing (underwater WSN)	Simulations (ns-2) -250 sensors in $500^3 m^3$ space -100m transmission range - fixed source/sink - 1m/s maximum speed for intermediate nodes	State: $\mathcal{N}_i$ Reward: function of the residual energy of the node receiving the packet and the energy distribution among its neighbor nodes.	Next-hop nodes to destination U packet withdrawal	<ul style="list-style-type: none"> <li><math>S = \#nodes</math></li> <li><math>A = 1 + \#neighbors</math></li> </ul>	Compared to Q-learning: <ul style="list-style-type: none"> <li>Faster convergence (40 episodes less)</li> <li>Less sensitive to initial parameters</li> </ul>

**Table 9** Summary of RL-based decentralized, partially decentralized, and centralized routing models (Continued)

Lin et al. [277]	$n$ -step TD (greedy)	Delay-sensitive application routing (multi-hop wireless ad hoc networks)	Simulations 2 users transmitting video sequences to the same destination node. 3 ~ 4-hops wireless network	State: current channel states and queue sizes at the nodes in each hop Reward: goodput at destination	Next-hop nodes to destination	<ul style="list-style-type: none"> <li><math>S = n_q \times n_c^H</math></li> <li><math>A = (N_p^2)^{H-1} \times N_h</math></li> <li><math>N = \#nodes</math></li> <li><math>N_h = \#nodes</math> at hop <math>h</math></li> <li><math>H = \#hops</math></li> <li><math>n_q = \#queue</math> states</li> <li><math>n_c = \#channel</math> states</li> </ul>	Complexity $\approx 2 \times 10^8$ for the 3-hop network. With 95% less information exchanges. ~ 10% higher PSNR - slightly slower convergence (+1 ~ 2sec)
d-Adaptor [59]	Q-learning with adaptive learning rate ( $\epsilon$ -greedy)	Opportunistic routing (multi-hop wireless ad hoc networks)	Simulations on Qual-Net with 36 randomly placed wireless nodes in a 150m x 150m	State: $M_i$ Reward: <ul style="list-style-type: none"> <li>fixed negative transmission cost</li> <li>the destination is receiver is not</li> <li>fixed positive reward if receiver is the destination</li> <li>0 if packet is withdrawn</li> </ul>	Next-hop nodes to destination U packet withdrawal	<ul style="list-style-type: none"> <li><math>S = \#nodes</math></li> <li><math>A = 1 + \#neighbors</math></li> </ul>	After convergence ( $\approx 300sec$ ) <ul style="list-style-type: none"> <li>ETX comparable to a topology-aware routing algorithm</li> <li>&gt; 30% improvement over greedy-SR, greedy ExOR and SRCR with a single flow</li> <li>Improvement decreases with # flows</li> </ul>
QAR [276]	Centralized SARSA ( $\epsilon$ -greedy)	QoS-aware adaptive routing (SDN)	Sprint GIP network trace-driven simulations [418] . 25 switches, 53 links	State: $M_i$ Reward: function of delay, loss, throughput	Next-hop nodes to destination	<ul style="list-style-type: none"> <li><math>S = \#nodes</math></li> <li><math>A = \#neighbors</math></li> </ul>	Compared to Q-learning with QoS-awareness: <ul style="list-style-type: none"> <li>Faster convergence time (20 episodes less)</li> </ul>

<sup>a</sup>  $M_i$ : node  $i$ ;  $D_k$ : sink  $k$ ;  $S$ : number of state variables;  $A$ : number of possible actions per state; #: number of<sup>b</sup> Average values. Results vary according to experimental settings.
